

- 1) After opening TMPGEnc Video Mastering Works 5.0, select the New Project button.

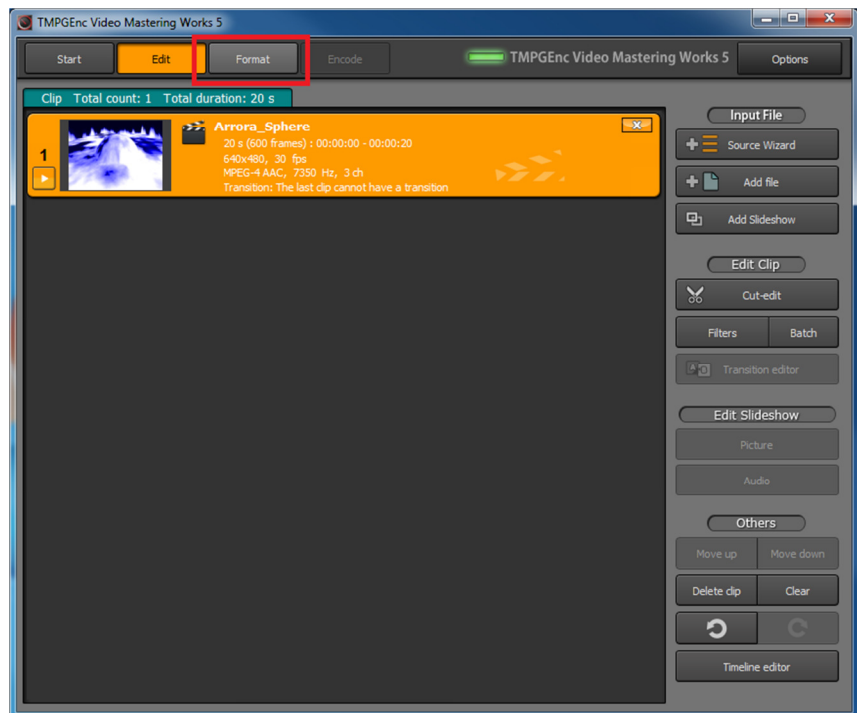

- 2) After selecting the New Project button, the "Source Wizard" will appear. Select the "From Files" source which will open a File Browser window. Find the content to be encoded and select "Open"

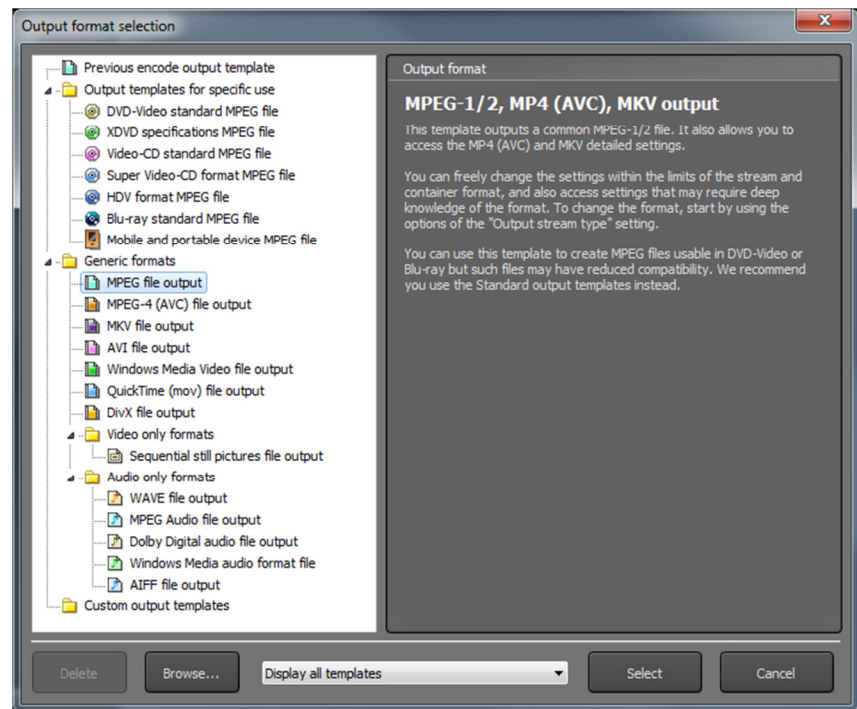

- 3) Video Master Works will analyze the clip and display the information it has found. Verify that the clip is correct, then select OK

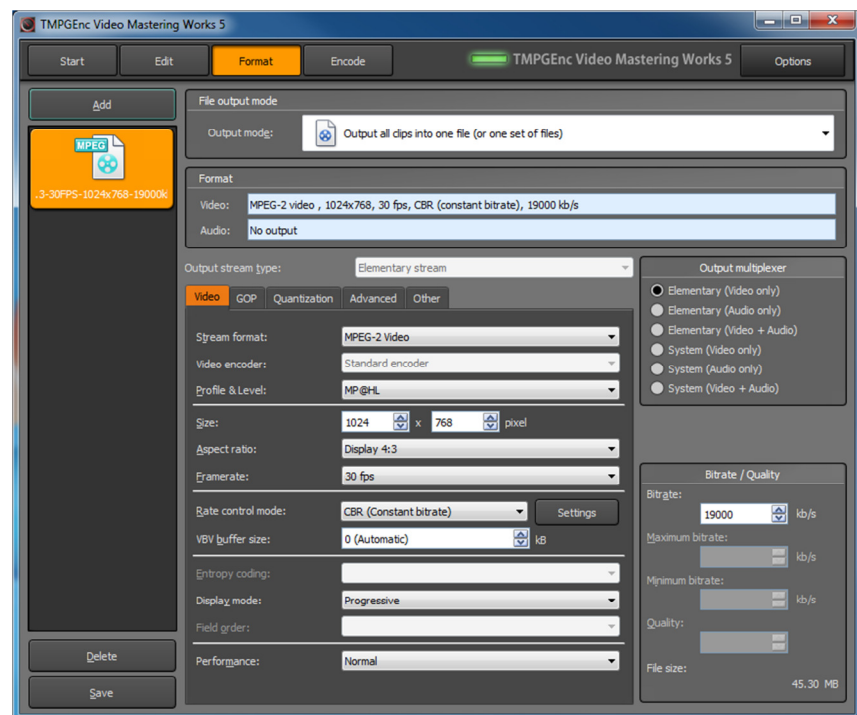

- 4) Select "Format"

- 5) In the Output Format Selection window, select “Browse...” at the bottom to browse to a preconfigured template, or select “MPEG file output” from the list.

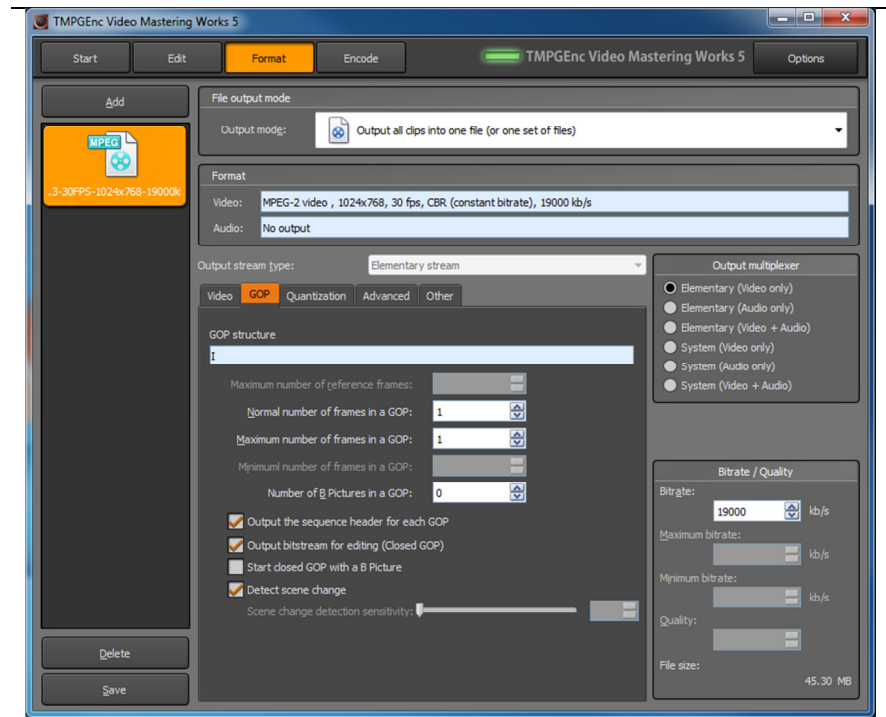

- 6) If you are using a preconfigured template, skip to step 8. Otherwise, in the Video Box, select the required settings. These settings can be found on the High End Systems website [here](#)

- 7) In the GOP frame, set both the “Normal number of Frames in a GOP” and “Maximum number of frames in a GOP” to 1.

Set “Number of B Pictures in a GOP” to 0, and select the “Output bitstream for editing (Closed GOP)” check box.

When your settings are finished, select the “Encode” box at the top of the page.

- 8) When your settings are finished, select the “Encode” box at the top of the page. Once on the “Encode Preview screen”, click the “Browse...” button to select where your clip will be outputted and what its name will be. Then Click “Export” to begin encoding.
